Several 3,6-bisethynyl-9H-fluoren-9-one derivatives were synthesized by palladium-catalyzed coupling of terminal alkynes with arylhalides (Sonogashira coupling).

Key Words: 3,6-Bisethynyl-9H-fluoren-9-one, PdCl$_2$(PPh$_3$)$_2$, Sonogashira coupling.

INTRODUCTION

Sonogashira et al.\textsuperscript{1} reported the coupling of terminal alkynes with aryl or alkenyl halides. Sonogashira coupling is carried out in the presence of catalytic amount of a palladium(II) complex as well as copper(I) iodide in an amine as solvent. This coupling is one of the most straight forward methods for the preparation of arylalkynes and conjugated enynes.

Cassar, Dieck and Heck\textsuperscript{2,3} had communicated the similar couplings under different conditions, using only palladium catalyst. Such $sp$ to $sp^2$ coupling of copper(I) aryl acetylenes with iodoarenes\textsuperscript{4} or iodoalkenes\textsuperscript{5} has been reported for the synthesis of acetylenes but its scope mean while limited by the violent reaction conditions and by the difficulties in preparations of cuprous acetylides. Herein, the synthesis of 4 new symmetrically bisethynyl fluorenone derivatives which are key compounds for quinodimethane derivatives are reported. Quinodimethane derivatives assemble itself to a spherical acyclic tetramer in high yield. This spontaneous self-assembly process is driven by the four weak C$_{sp^3}$C$_{sp^3}$ bonds between the fluorene units that are formed during the tetramerization\textsuperscript{6,7}.

EXPERIMENTAL

Melting points are taken on a buchi SMP-20 apparatus and are uncorrected. $^1$H NMR spectra were recorded on Bruker AM-400 MHz in CDCl$_3$ using TMS as an internal standard. Elemental analysis were carried out on Carlo-Erba-Analyzer model 1104. FT-IR spectra were recorded on a bruker IFS-25 spectrophotometer. The palladium (II) chloride bis(triphenylphosphane) was prepared according to the method of King and Negishi\textsuperscript{8}. Trimethylsilyl acetylene was prepared according to the Overman et al. method\textsuperscript{9}. All other chemicals were of reagent grade and were used without further purification.

RESULTS AND DISCUSSION

3,6-Dibromophenanthren-9,10-dione (2) was prepared from the reaction of 9,10-phenanthrenquinone (1), bromine and benzoyl peroxide in nitrobenzene as solvent according to the literature procedures⁴,¹¹.

![Scheme-I](image)

3,6-Dibromo-9H-fluoren-9-one (3) was prepared from 3,6-dibromophenanthren-9,10-dione (2) by literature procedure⁵. 3,6-Bis[(trimethylsilyl)ethynyl]-9H-fluoren-9-one (4) was synthesized from the reaction of 3,6-dibromo-9H-fluoren-9-one (3) and trimethylsilyl acetylene with improved procedure for Sonogashira Coupling⁶.

3,6-Bis[(tert-butyl)ethynyl]-9H-fluoren-9-one (5) was synthesized from the reaction between 3,6-dibromo-9H-fluoren-9-one (3) and 3,3-dimethyl-1-butyne with the same procedure⁶.
3,6-Bisethynyl-9H-fluoren-9-one (6) was obtained from the reaction between 3,6-bis[(trimethylsilyl)ethynyl]-9H-fluoren-9-one (4) and potassium carbonate in methanol according to the literature procedure⁶.

Acetylenic hydrogens in 3,6-diethynyl-9H-fluoren-9-one (6) may be easily substituted by iodo and bromo aryls in the presence of a catalytic amount of a palladium(II) complex as well as copper (I) iodide in an amine as solvent. The reactivity of the coupling of aryl bromides is often slower than the reactivity of the aryl iodides and thus we used DMF as solvent which increase the rate of the transformation according to the procedure¹².
