INTRODUCTION

Bawang hutan (wood garlic), *Scorodocarpus borneensis* Becc. which belongs to the family Olacacea, is a tall tree which attain a height c.a 20 metres and easily recognized by its onion smell like a garlic. Garlic of the *Allium* genus, one of the most widely known spices, is noted for the enzymatic formation of large amount of organic sulphur compounds when it is crushed. The powerful flavor and possible medical application of the decomposed sulphur products have attracted the attention of chemist for more than a century, as many reviews have been published. In contrast, chemical studies on “wood garlic” have not been done because the trees are grown only in very limited area as Sumatra, Borneo and the Malay peninsula. Since its smell and utility for cooking are very similar to garlic, the volatile flavor components and antimicrobial activity were investigated\(^1\-3\).

The leaves and barks of the plants were reported to contain sesquiterpene, scorodocarpine alkaloid (*scorodocarpine A-C*) and sulphur containing compounds\(^4\-6\). In the course of our research for bioactive metabolites from the plants used in traditional medicine, therefore it’s interested in characterizing the chemical constituents. In this report, the structure characterization of isolated compounds 1 and 2 (Fig. 1) from the fruit of *S. borneensis* will be discussed.

EXPERIMENTAL

\(^1\)H and \(^13\)C NMR spectra were recorded at 500 MHz (\(^1\)H) and 125 MHz (\(^13\)C) on Jeol Spectrometer using Deutereud solvent for calibration of the spectra. IR spectra were recorded on Shimadzu FTIR 8500 Spectrophotometer in KBr disc. The UV-visible spectrum was obtained on a Shimadzu UV-visible spectrophotometer (UV 160 PC). Column chromatography (CC) were performed on silica gel Merck 9385 (230-400 mesh). *Scorodocarpus borneensis* was collected in Samarinda, East Kalimantan Indonesia. A voucher specimen was identified and deposited at Herbarium Bogoriensis Research Center for Biology, Indonesian Institute of Sciences (LIPI) Cibinong Indonesia.

**EXTRACTION AND ISOLATION:** Small slices of fruit (500 g) were macerated with n-hexane and then the residue was macerated with ethylacetate and ethanol respectively. n-Hexane extract then was evaporated under reduced pressure to give a greenish yellow mass (16.93 g). A portion of this extract (10 g) was preabsorbed on silica gel and chromatographed over a column silica with increasing amount of ethylacetate in n-hexane. Fractions which gave similar pattern on TLC were combined and tested for antioxidant activity (DPPH test)\(^7\). The most active fraction was chromatographed in same way to give dehydroxy scorodocarpine B (1) and scorodocarpine B (2).
The MS spectrum (LC-MS) of dehydroxy scorodocarpine B (1) showed a molecular ion peak at m/z 480 (M') that corresponded to a molecular formula C_{38}H_{39}O_{11}. The $^1$C NMR spectrum of this compound (Table-1) supported the molecular formula and application of the DEPT techniques revealed that there were 1 methyl, 1 carboxyl, 18 methylenes and 8 carbons for tryptamine (5 methines and 3 quartenary carbons) and 2 methylenes for olefinic. One carbonyl ($\delta_c$ 173.34 ppm) was assigned to amide carbonyl group, as well as confirmed by the presence of carboxyl bond at IR spectrum.

### RESULTS AND DISCUSSION

The 1H and $^1$C NMR spectra of these molecules were interpreted by the assistance of two dimensional (2-D) NMR techniques. The 1H and $^1$C correlation spectroscopy (HMQC) of 1 revealed the connection between respective protons and carbons (Table-1). The plane structure of 1 was constructed on the basis of $^1$H-1H COSY correlation spectroscopy ($^1$H-1H COSY) and correlation spectroscopy carried out through the Hetero Multiple bond connectivity (HMBC) NMR experiments. Thus, the $^1$H-1H COSY of 1 indicated the presence of 3 partial structure: from C-4 to C-7; C-10 to C-11 and C-2' to C-22 (Fig. 2). The HMBC spectrum of 1 displayed long range correlations between methine proton at $\delta_1$ 7.37 (H-4) with carbons at $\delta_c$ 122.16 (C-5); 118.93 (C-6) and 119.68 (C-7) and between methine proton at $\delta_1$ 7.61 (H-7) with carbons with at $\delta_c$ 122.16 (C-5); 118.93 (C-6) and 136.57 (C-8)and between methine proton at $\delta_1$ 7.03 (H-2) with carbons at $\delta_c$ 136.57 (C-8); 113.29 (C-3); 127.53 (C-9) of tryptamine ring.

Methylen proton at $\delta_1$ 3.60 (H-11) with carbons at $\delta_c$ 25.55 (C-10); 113.29 (C-3) and 173.34 (C-1'), methine proton at $\delta_1$ 5.35 (H-13') with carbon at $\delta_c$ 27.39 (C-12') and methyl proton at $\delta_1$ 0.88 (H-22') with carbons at $\delta_c$ 22.87 (C-21') and 32.09 (C-20') of ring mono-unsaturated with 20 carbons.

The $^1$H-$^1$H correlation spectroscopy COSY and the HMBC experiments showed the compound 1 has a N-acetyl-5-hydroxy-tryptamine type structure which the acyl residue as unsaturated (20 carbons) for compound 1 (Table-1).

Confirmation for chemical structure of compound 1 was carried out by comparing scorodocarpine B compound isolated by Wiart et al.$^5$ showed that compound 2 gave proton signal at C-5 ($\delta_1$ 7.21 ppm; $\delta_c$ 422.6 ppm), indicated that a hydroxyl group from scorodocarpine compound was missing ($\delta_c$ 150.2 (s) (Table-2). Thus, chemical structure of 1 is dehydroxy-scorodocarpine B as a new compound.

The MS spectrum of compound 2 showed a molecular ion peak at \( m/z \) 496, corresponding to a molecular formula of \( C_{32}H_{52}O_2N_2 \). The \( ^{13}C \) NMR spectrum of this compound (Table-2) supported the molecular formula and application of the DEPT techniques revealed that there were 1 methyl, 20 methylenes, 6 methines and 5 quaternary carbon including carbonyl group. Confirmation for chemical structure of compound 2 with 2-D NMR (HMOC, COSY, HMBC) and compared with scorodocarpin B data (Tables 1 and 2), compound 2 identified as scorodocarpine B.
